ABSTRAK

Latar Belakang: Peran keluarga sangat penting dalam proses pengobatan penyakit. Keluarga memiliki peran terapeutik guna memberikan perawatan luka post operasi. Keberadaan peran keluarga diperlukan untuk merawat anggota keluarga.

Tujuan: Tujuan penelitian ini adalah untuk mengetahui gambaran peran keluarga dalam perawatan luka post operasi.

Metodologi Penelitian: Jenis penelitian kuantitatif dengan metode deskriptif menggunakan desain pendekatan *cross sectional*. Populasi penelitian yaitu keluarga yang mendampingi pasien post operasi yang melakukan kontrol ke poli bedah RSUD Dr. Soedirman. Sampel berjumlah 56 responden dipilih menggunakan teknik *consecutive sampling*. Pengumpulan data menggunakan kuesioner yang diisi oleh responden.

Hasil Penelitian: Berdasarkan karakteristik responden yang dominan berada dalam rentang usia dewasa tengah (31-54 tahun), berjenis kelamin perempuan, tingkat pendidikan SMA, status bekerja, dan berpenghasilan > Rp 1.560.000,-. Keluarga menjalankan peran keluarga dalam perawatan luka post operasi dengan cukup baik.

Kesimpulan: Uji korelasi menunjukkan adanya hubungan antara pendidikan ($r=0,622$ dan $p=0,000$), pekerjaan ($r=-0,269$ dan $p=0,031$), dan penghasilan per bulan ($r=0,591$ dan $p=0,000$) dengan peran keluarga dalam perawatan luka post operasi.

ABSTRACT

Background: The role of the family is very important in the treatment of disease. Families have a therapeutic role in order to provide postoperative wound care. The existence of family roles needed to care for family members.

Objective: The purpose of this study was to describe the role of the family in the postoperative wound care.

Methodology: Type of quantitative research with descriptive method using cross sectional approach design. The study population was families who accompanied postoperative patients during control at the poly surgical Hospital Dr. Soedirman. Sample of 56 respondents were selected with consecutive sampling technique. Collecting data using questionnaires filled out by respondents.

Result: Based on the dominant characteristics of the respondents are in the middle adult age range (31-54 years old), female, high school education level, employment status, and income > Rp 1.56 million. The family carries out the family role in the postoperative wound care quite well.

Conclusion: Correlation test shows the relationship between education ($r=0.622$ and $p=0.000$), employment ($r=-0.269$ and $p=0.031$), and income per month ($r=0.591$ and $p=0.000$) with the role of the family in postoperative wound care.
